

My name is Giulia Treccani and my research focuses on the effects of early life adversity on the role of glial cells, in particular oligodendrocyte progenitors. I have studied Pharmacy (University of Milan) and obtained my PhD in Neuropsychopharmacology. After my PhD, I spent several years as a postdoctoral researcher in Denmark (Aarhus University) and in Germany (University of Mainz) and several periods as a visiting scientist in Sweden (Lund University, Malmö). Since October 2023 I have been working at the University of Marburg (Germany) as a professor of neuroanatomy with a focus on systemic neuroscience. During the last years I have participated in the activities of the EBBS Society, especially in the EBBS Conferences. Unlike other societies, I found EBBS to be an open and friendly community where the interaction between scientists is rather easy and encouraged by the senior members. I had the opportunity to organize a symposium at the EBBS conference in Amsterdam in 2023, which was a very rewarding experience. I would like to participate even more actively in this community by joining it as an ordinary member and I would be happy to serve the society in organizing the next scientific events.
